The good type of pressure

Your complete guide to feeling better, moving better and living well

Each tip is rooted in evidence and drawn from our own clinical experience. None of them require a dramatic lifestyle change. All of them, done consistently, will make a real difference.

The good type of pressure

Back pain is the leading cause of workplace absence in the UK, and the single biggest cause is sitting still for too long.

Most of us spend the majority of our working day in a chair — and our bodies simply weren't designed for it. Lack of movement means there's no muscular support for your spine, your hip flexors shorten, your posture deteriorates, and tension builds up in places you may not even notice until it becomes pain.

The good news is that the fix doesn't require a gym membership or a dramatic lifestyle overhaul. It requires movement — little and often, built into your existing day.

At Lucy Hall Massage Therapy, we see the same pattern repeatedly — clients who sit for long hours arrive carrying tension in their upper back, neck and glutes. Regular movement, combined with a monthly deep tissue or sports massage, is the most effective combination we've found for keeping this at bay.

What you can do:

- Get up from your desk regulay; set a timer if you need to
- Try a short walk at lunchtime, even just around the block
- Use stairs instead of the lift when possible
- Stretch your neck and shoulders gently at your desk — tilt, roll, and hold for 10 seconds
- Consider a sit-stand desk if you're spending more than 6 hours a day seated

We live in a culture that celebrates effort, but neglects recovery. The two are inseparable; without recovery, effort is unsustainable

Whether you're an athlete, a desk worker or a parent on their feet all day, your body undergoes physical stress every single day. Muscles tighten, fascia thickens, joints lose mobility, and the nervous system remains in a low-level state of alert. Left unaddressed, this accumulates into chronic tension, pain, fatigue and injury.

Recovery isn't just sleep (though sleep is crucial — more on that shortly). It's the active practice of helping your body return to its natural resting state. And massage therapy is one of the most evidence-based tools available for doing exactly that.

A regular Swedish or relaxation massage has been shown to reduce cortisol (the stress hormone) by up to 43% and increase serotonin by 54%. It's not a treat — it's a measurable health intervention.

What you can do:

- Book a massage regularly; for general wellbeing, monthly is a good baseline; for active or physically demanding lifestyles, fortnightly is ideal
- Use a tennis ball on tight areas between appointments
- Prioritise 7–9 hours of sleep; this is when your body repairs muscle tissue and consolidates memory
- Take rest days seriously, they are not optional extras
- Listen to your body: persistent pain, fatigue or tightness are signals, not weaknesses

Stress doesn't just affect your mental health; it lives in your body. Tight shoulders, jaw clenching, shallow breathing, headaches. These are all manifestations of stress.

In recent years, hundreds of thousands of UK workers have suffered from work-related stress,depression or anxiety. When we're stressed, our bodies produce cortisol and adrenaline; hormones designed for short-term threat responses, not for sustained daily pressure. Over time, chronically elevated cortisol disrupts sleep, weakens the immune system and contributes to muscle tension.

The most effective stress management strategies are those that activate the parasympathetic nervous system; the body's rest-and-digest mode. To counterbalance the fight-or-flight response.

If you feel tension regularly in your neck, shoulders or jaw, it's almost certainly stress-related. An Indian head massage or relaxation massage is specifically designed to address these areas — and many clients report sleeping significantly better after a session.

What you can do:

- Practise belly breathing; breathe in slowly, letting your abdomen expand, then exhale fully.
- Try progressive muscle relaxation; starting at your toes, tense & release each muscle group up through your body
- Spend time in nature; even 20 minutes outdoors three times a week has been shown to lower stress hormone levels
- Use the Shen Men pressure point; gently massage the cartilage fold at the top of your ear to activate this traditional auricular acupressure point

What you eat has a more direct effect on how your body feels, moves and recovers than almost any other single factor.

This isn't about following a strict diet or eliminating food groups. It's about understanding that your body is a system that runs on what you put into it — and that giving it the right fuel makes everything else easier. Energy levels, mood, sleep quality, muscle recovery, immune function and inflammation are all directly influenced by nutrition.

The NHS Eatwell Guide remains one of the most practical and evidence-based frameworks for general healthy eating: roughly a third of your plate as vegetables and fruit, a third as starchy carbohydrates, and the remainder as proteins and dairy or dairy alternatives. Hydration is equally important — most people are mildly dehydrated for most of the day, and this alone causes fatigue, headaches and reduced concentration.

Clients who are well-nourished and hydrated consistently get more from their massage sessions —muscles are more supple, circulation is better, and the body responds more readily to manual therapy.

What you can do:

- Eat more oily fish, leafy greens, nuts and seeds; these are anti-inflammatory and support musclerecovery
- Aim for at least 6–8 glasses of water a day — more if you are physically active
- Don't skip breakfast if you have a physically or mentally demanding morning
- A small amount of dark chocolate (70%+) contains magnesium, which supports muscle relaxation

Physical health and mental health are not separate systems. They are one system.

The connection between mental and physical health is now well-established by research. Chronic stress causes physical inflammation. Depression reduces pain tolerance and slows physical recovery. Anxiety creates muscular tension. Conversely, physical exercise elevates mood, massage reduces anxiety, and good sleep improves emotional resilience.

Building habits that support your mental wellbeing is one of the highest-return investments you can make in your overall health. This doesn't require significant time or expense — consistency matters far more than intensity.

Self-care is not a luxury. It's the foundation that makes everything else possible — your work, your relationships, your physical health. A regular massage is one of the simplest ways to give your nervous system permission to rest.

What you can do:

- Keep a mood or journal diary; noticing patterns helps you respond rather than react
- Socialise regularly; even brief positive social contact has measurable immune and mood benefits
- Set clear work boundaries; log off at a consistent time and protect your evenings
- Laugh, genuinely and often; laughter has been shown to reduce pain perception and raise mood
- Seek professional support early; talking therapies and massage therapy work well in combination
